

The Doctors of Blue Valley Eyecare are dedicated to providing our patients the highest quality of care.

We offer and highly recommend the **OPTOS**, an optional retinal imaging test.

**OPTOS** is a digital image of the retina, there are no side effects from this test as you would get from dilation. This retinal digital image helps the doctors detect early signs of vision threatening diseases such as; glaucoma, macular degeneration, diabetic retinopathy, retinal detachments.

The retinal image will become a permanent part of your medical records for comparison with images from future exams.

Retinal imaging is recommended for all patients, but highly recommended for patients who have or may have family history of:

- \*Glaucoma, macular degeneration, or loss of vision
- \*Diabetes, heart disease or high blood pressure
- \*Spots or flashes of light in vision, headaches
- \*High cholesterol
- \*History of smoking

The fee for this additional retinal imaging test is **\$39.00** and **is** the patients responsibility

**INSURANCE MAY NOT COVER THIS PROCEDURE.** (Unless a medical diagnosis is found)

You may use your **Flexible Spending Account** to cover the cost of the **OPTOS**.

**YES** I choose to have the retinal imaging performed.

**NO** I choose not to have the retinal image performed, and prefer **dilation**.
